

Steering Wheel

1. OVERTAKE BUTTON: Changes the fuel map to 100 percent rich for a set amount of time, allowing the engine to produce the extra power needed to complete a pass or hold off another driver.

2. PI DASH: Displays warning lights and information the driver needs during the race. That information includes lap times, oil, water and gearbox temperatures and fuel mileage.

3. RPM SHIFT LIGHTS: LED lights that go from green to red and indicate engine RPM. When the red lights are on the driver shifts gears.

4. PIT LANE SPEED LIMITER: Used on pit lane by the driver to activate the engine control program limiting the car's speed to the pit lane speed limit, which is usually 60 miles per hour.

5. PULL-TO-TALK (BEHIND THE CARBON): Activates the microphone in the driver's helmet so he can communicate over the radio.

6. RESET: Used during the race. During a pit stop the driver pushes this button to reset the fuel reading on his display.

7. FUEL MAP SWITCH: Allows the driver to adjust the fuel mapping of the engine to increase fuel mileage or to increase power. There are a number of settings available including full rich, where the engine produces maximum power but uses more fuel. There is also a lean setting which uses less fuel but produces less power. During caution periods the drivers will switch to the leanest mixture to increase fuel economy.

8. DASH SCROLL: Allows the driver to scroll through the different pages available on the dash board, including the race page, qualifying page and practice page.

9. WEIGHT JACKER: Adjusts the cross weight on the car from left to right. The weight jacker allows the driver to make fine-tuning adjustments as the car begins to handle differently during the race.

10. DRINK (BEHIND THE CARBON): Allows the driver to get a drink of water during the race. It activates a pump connected to a water bottle on the car which pumps water through a hose installed in the driver's helmet.

**Button positions are customized to suit driver's preferences*
